

Reva • Broken-leg follow-up

Local demo brief • Sep 17, 2026 at 10:30 AM

Your focus

Follow-up of my August right distal fibula fracture, walking comfort, and prior right tibial hardware.

Goal: Review interval lower-leg imaging and the older tibial implant record, and prepare questions about recovery from the new fibula fracture.

My orthopedic preparation note

SYNTHETIC DEMO - FICTIONAL PATIENT PREPARATION NOTE

Jordan Avery (Synthetic) | Source date: 2026-09-12

ORTHOPEDIC VISIT PREPARATION

I want to bring the August 29 lower-leg imaging report and the older right tibia implant inventory to the September 17 visit. My new injury is in the distal fibula; the nail is from the tibia repair in 2019.

QUESTION TO ADD

Which changes in walking comfort should I describe when comparing this week with the day of the injury?

This unseeded sample is intended for a manual import demonstration. It is not a clinical recommendation or a real patient document.

Right lower-leg follow-up radiology report

EXAMINATION

RIGHT TIBIA AND FIBULA, two views. Examination date: August 29, 2026. Comparison: August 22, 2026

study described in the injury encounter.

CLINICAL HISTORY

Follow-up after a right distal fibula fracture. Remote right tibial fixation in 2019.

FINDINGS

The described distal fibula fracture remains visible with no interval change in alignment on the provided

comparison. An intramedullary nail and locking screws are present in the right tibia. The hardware is described

as intact on this examination.

IMPRESSION

Documented distal fibula fracture with unchanged alignment. Remote tibial fixation hardware remains in place.

Clinical follow-up is referenced in the encounter record.

SOURCE BOUNDARY

This synthetic written report has no attached radiographic images and cannot be used to interpret an actual

image or establish healing status beyond the text above.

Right distal fibula fracture - initial assessment

REASON FOR ENCOUNTER

Right ankle and lower-leg discomfort after a missed step on August 22, 2026. The patient reported swelling

and reduced walking comfort.

DOCUMENTED ASSESSMENT

The source note records a right distal fibula fracture after review of initial radiographs. It also records the

patient's prior right tibial nail from a 2019 tibial fracture repair.

CARE ALREADY DOCUMENTED

The encounter note states that a walking boot was supplied and follow-up with orthopedics was arranged. This

demo document does not add activity, weight-bearing, or treatment instructions.

QUESTIONS CARRIED FORWARD

The patient wants to discuss walking comfort, interval imaging, and whether the prior tibial hardware affects

how the new injury is assessed.

SOURCE BOUNDARY

This is the initial assessment of the 2026 fibula injury. It is not the 2019 tibial operation and does not document

a new implant.

Tibia implant record · reviewed

IMPLANT INVENTORY - HISTORICAL SOURCE

Implant location: RIGHT TIBIA. Device category: intramedullary tibial nail. Retained components documented:

one nail and proximal and distal locking screws. Placement date: April 18, 2019.

DEVICE IDENTIFICATION

Manufacturer, model, material, and serial or lot numbers are intentionally not supplied in this synthetic dataset.

No imaging-compatibility conclusion can be made from this inventory.

INVENTORY SCOPE

This page records the components placed during the same operation as page 1. It does not record subsequent

imaging, hardware removal, or repeat surgery.

SOURCE BOUNDARY

These are invented historical details for testing source retrieval across dates and PDF pages. An operative

inventory alone does not describe a later clinical course.

Medication, allergy and health history

PURPOSE

Medication and allergy reconciliation for the fictional patient's shared visit history.

ALLERGY

Penicillin: rash reported in childhood. This record does not describe the original reaction or a formal allergy

test.

MEDICATIONS REPORTED ON SEPTEMBER 1

Albuterol inhaler, 90 mcg per actuation: as-needed use is documented in the existing medication list. Cetirizine,

10 mg: patient-reported seasonal use. No new prescription or change is documented here.

MEDICAL HISTORY

Intermittent asthma. Prior right tibial fracture repair in 2019 with retained hardware. A separate right distal

fibula fracture occurred on August 22, 2026.

PATIENT CONTEXT

The patient wants appointment summaries that keep prior documentation separate from current questions.

This list reflects information recorded on September 1 and may require reconciliation at the next visit.

Source: Medication, allergy and health history · p. 1

Asthma history and medication context

DOCUMENTED HISTORY

Intermittent asthma appears in the fictional health history. The encounter note records an albuterol inhaler on the existing medication list. No hospital stay or acute respiratory complaint is documented in this particular encounter.

PATIENT-REPORTED MEDICATION CONTEXT

Albuterol inhaler, 90 mcg per actuation: as-needed use documented in the source medication list. Cetirizine, 10 mg: seasonal use reported by the patient.

This note does not introduce a new medicine or change an existing instruction.

SOURCE BOUNDARY

This note gives historical context for medication reconciliation. It contains no attribution of symptoms to a medicine and no separate symptom assessment.

Source: Asthma history and medication context · p. 1

Information to confirm

Confirm current medications, allergies, symptom timing, and any changes since these records were written. This brief contains selected source excerpts; it is not a clinical assessment.

Questions to bring

1. Next steps?

Your notes

Synthetic upcoming visit. The old tibial fixation and new fibula fracture are separate events.
