

REVA / SYNTHETIC SOURCE LIBRARY

Prior right tibia fixation and implant record

Jordan Avery (Synthetic) | DOB: 1991-04-16
Source: Sample Harbor Orthopedics (Fictional)
Source date: 2019-04-18

PROCEDURE RECORD

Date of procedure: April 18, 2019. Documented indication: right tibial shaft fracture following a recreational fall.
Procedure: intramedullary fixation of the right tibia.

OPERATIVE SUMMARY

The fictional operative record describes placement of a tibial intramedullary nail with proximal and distal locking screws. The implant inventory appears on page 2.

IMMEDIATE DOCUMENTATION

The operative record describes placement of the nail and locking screws during this encounter. It does not contain a later healing assessment or hardware-removal procedure.

SOURCE SCOPE

This operation concerns the right tibial shaft fracture described above. The procedure date and implant inventory are preserved for later comparison with other lower-leg records.

Invented for Reva software demonstration. Not a real patient record or medical advice.

IMPLANT INVENTORY - HISTORICAL SOURCE

Implant location: RIGHT TIBIA. Device category: intramedullary tibial nail. Retained components documented: one nail and proximal and distal locking screws. Placement date: April 18, 2019.

DEVICE IDENTIFICATION

Manufacturer, model, material, and serial or lot numbers are intentionally not supplied in this synthetic dataset. No imaging-compatibility conclusion can be made from this inventory.

INVENTORY SCOPE

This page records the components placed during the same operation as page 1. It does not record subsequent imaging, hardware removal, or repeat surgery.

SOURCE BOUNDARY

These are invented historical details for testing source retrieval across dates and PDF pages. An operative inventory alone does not describe a later clinical course.

Invented for Reva software demonstration. Not a real patient record or medical advice.
